

Moment distribution method

①

It is an iterative method to solve multi-span beam/frame problems. You must have learnt springs in parallel.

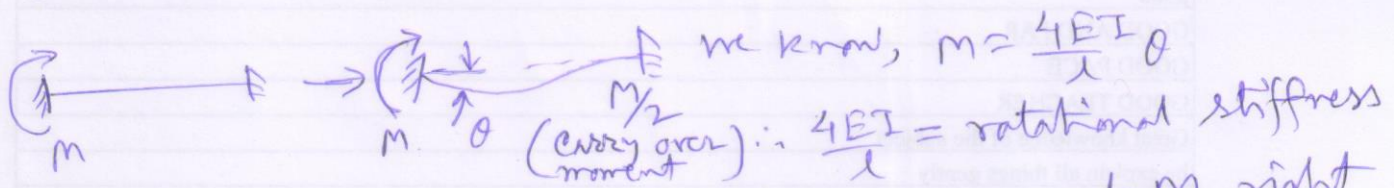

We want to find the force carried by each spring.
we can write: $K_1 \delta_1 + K_2 \delta_1 = F \Rightarrow \delta_1 = \frac{F}{K_1 + K_2}$

Force carried by 1st spring = $K_1 \delta_1 = \frac{K_1}{K_1 + K_2} F$

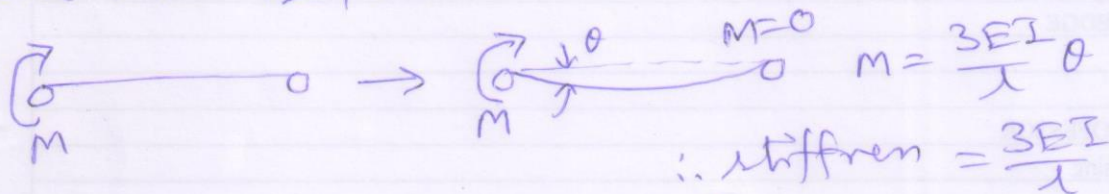

Force carried by 2nd spring = $K_2 \delta_1 = \frac{K_2}{K_1 + K_2} F$

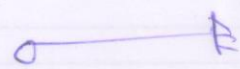

$\frac{K_1}{K_1 + K_2}$ or $\frac{K_2}{K_1 + K_2}$ are called distribution factors.

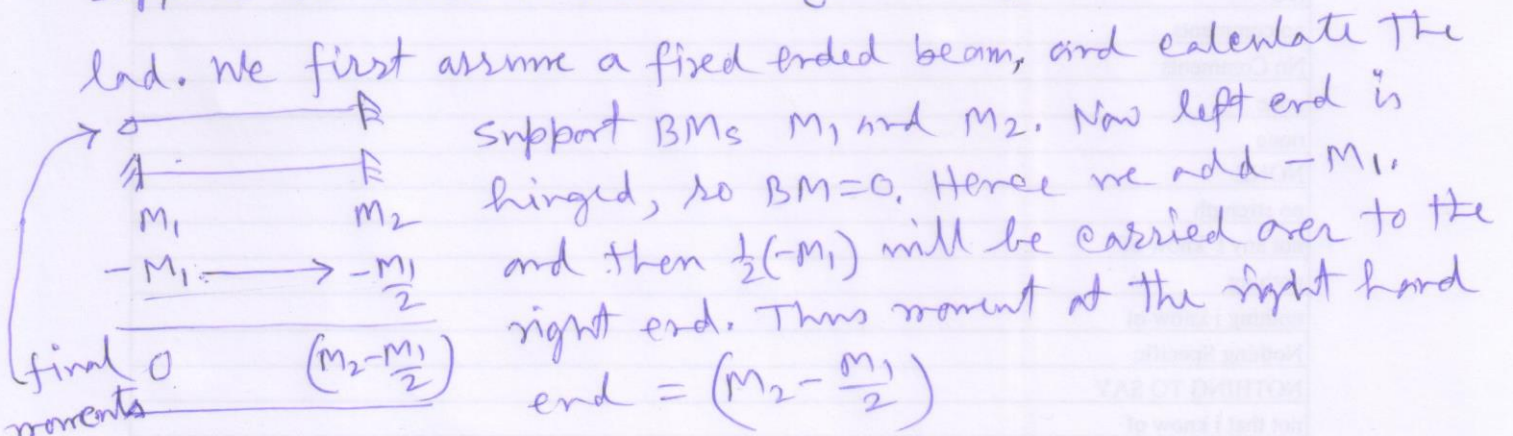

A beam can be conceived as rotational springs.

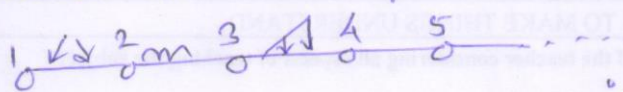

You can note that as the left end takes a moment \$M\$, right end takes $\frac{1}{2}$ of \$M\$.

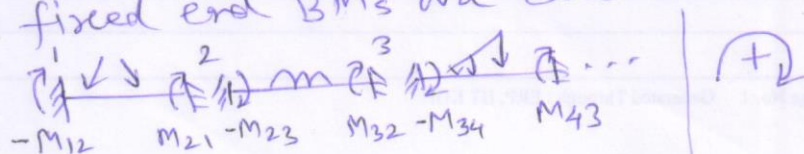

Suppose we have a beam  with same span

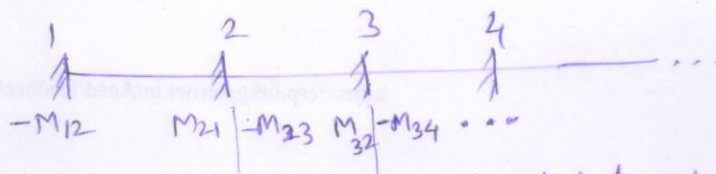

Let us consider a multi-span beam

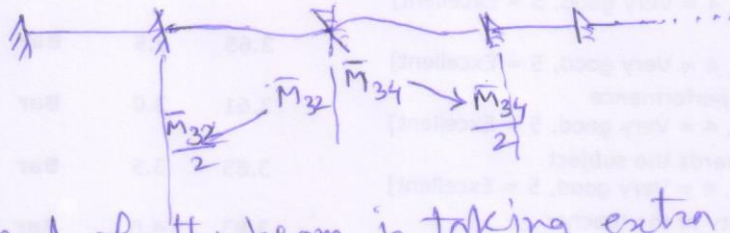

first we assume that all spans are isolated by fixed supports and the fixed end BMs are calculated.

As we can see that at each joint, there could be unbalanced moment (for eg., at 3, $(M_{32} - M_{34})$ is the unbalanced moment), which will be distributed/shared by the beams connected to the joint (eg. 32 and 34 are the beams connected at 3) and for that the joint will rotate to some extent. As if, by rotation of the joint, the beams are taking part of the unbalanced moment. This moment sharing will follow the distribution factors of the beams.

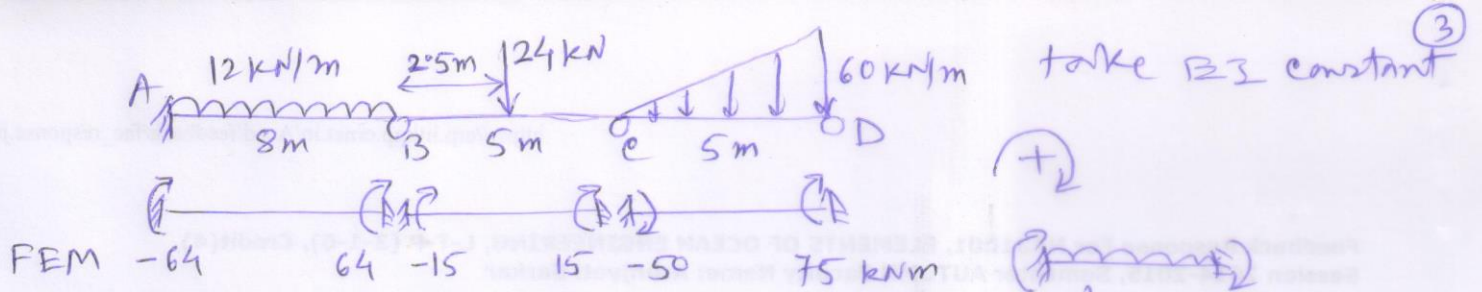

As one end of the beam is taking extra moment, $\frac{1}{2}$ of it will go to the other end as carry over.

This process will be followed at each of the joints. Once all carried over moments are estimated, it will again cause ~~imb~~ imbalance at the joint, and again this will be shared by the beams, ~~for~~ followed by carry over again...

This process will be repeated for few times unless carried over moment become very small, and then after distribution we can stop.

Note that if the ending/beginning joints are hinged, then there will be no carry over. If the ending/beginning joints are fixed support, no distribution is required since fixed support is having stiffness $= \infty$.

Go through the example below:

Note that end D is hinged, i.e., zero BM.

So we need to add -75 to make it "0".

| | | | | |
|-------------------|-----|----|-----|-----|
| | A | B | C | D |
| | -64 | 64 | -15 | 15 |
| | | | | -50 |
| | | | | 75 |
| final | | | | |
| Fixed | -64 | 64 | -15 | 15 |
| end moment | | | | |
| unbalanced moment | | | | |
| = 49. Hence -49 | | | | |
| to be added to | | | | |
| make resultant | | | | |
| moment = 0 | | | | |
| No carry over | | | | |
| from fixed end | | | | |
| | | | | |
| Balance | | | | |
| CO | | | | |
| Balance | | | | |
| CO | | | | |
| Balance | | | | |
| Total | | | | |

Distribution factors

BA - BC

$$\frac{4EI}{8} : \frac{4EI}{5}$$

$$= \frac{5}{13} : \frac{8}{13}$$

CB - CD

$$\frac{4EI}{5} : \frac{3EI}{5}$$

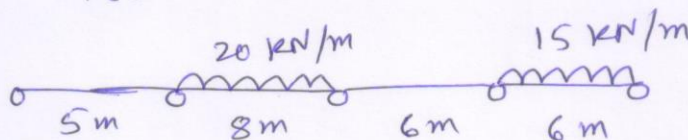

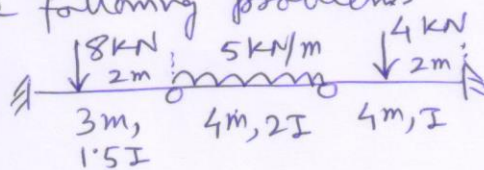

$$\frac{4}{7} : \frac{3}{7}$$

Since it is hinged support.

We can stop further iteration since the values are already small.

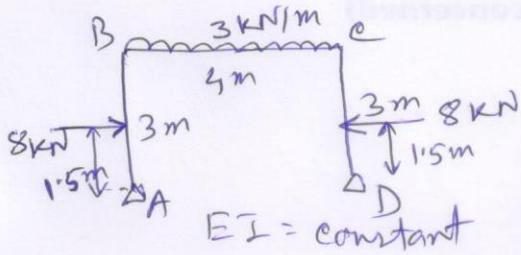

This is known as the moment distribution method.

Solve the following problems

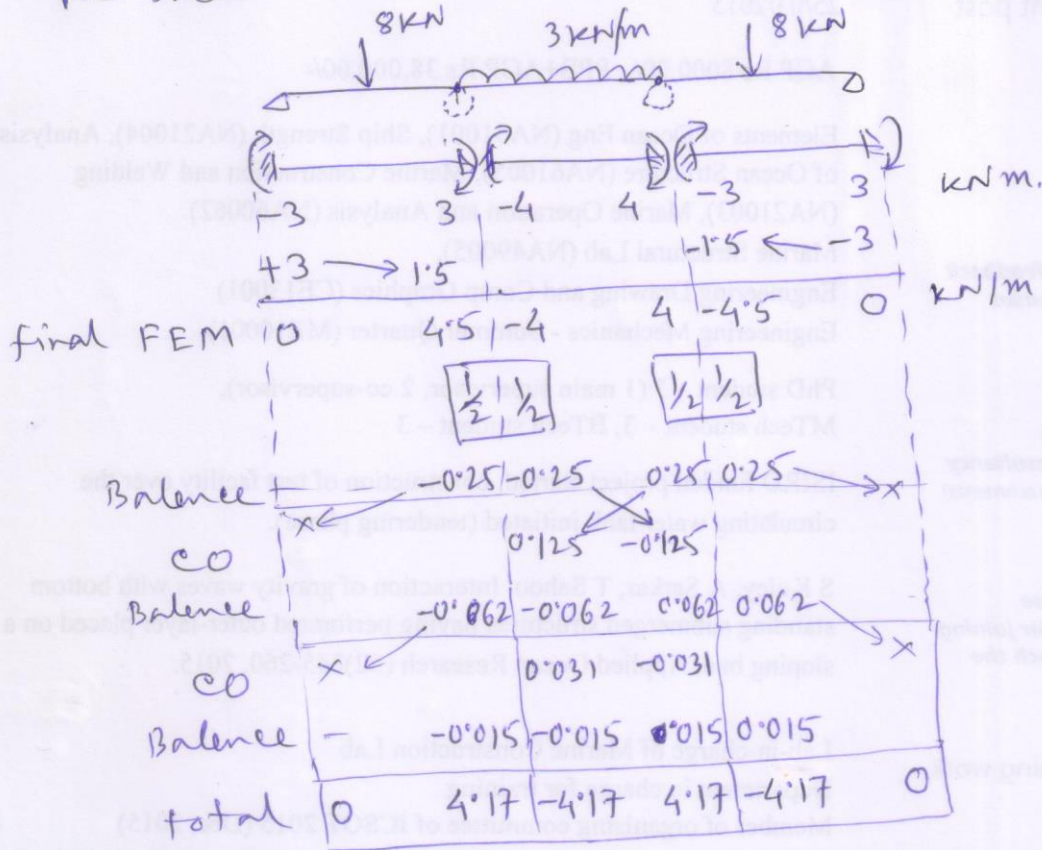

Solve the frame problem

④

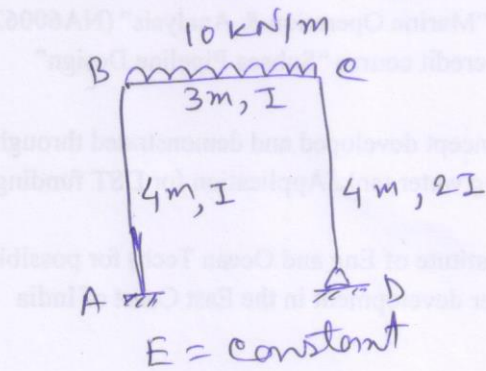

Here you can notice that the structure and the loading system are symmetric. Hence there will be no sway, i.e., no side way movement of BC.

We start with the unfolded diagram of the frame

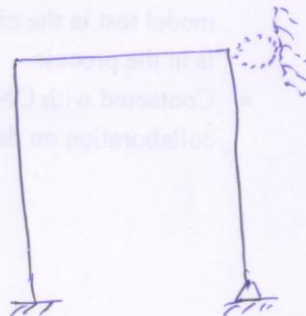

For an unsymmetric problem, the analysis has two steps, first no-sway analysis and then sway analysis. Take the example.

No-sway analysis is carried out putting a fictitious support against lateral sway.

Boundary condition is unsymmetric

distribution factors

BA-BE

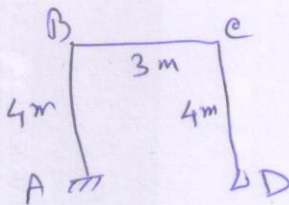

$$\frac{4I}{4} : \frac{4I}{3} = \frac{3}{7} : \frac{4}{7}$$

CB-CD

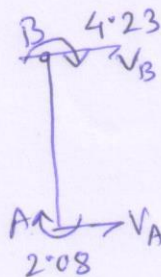

$$\frac{4I}{3} : \frac{3 \times 2I}{4} = \frac{8}{17} : \frac{9}{17}$$

No-sway analysis:
unfolded sketch of the frame:

| | | | | | | |
|---------|-------|------|---------------|---------------|-----------------|-------------------------------|
| | | | | | 10 kN/m | |
| FEM | 0 | 0 | -7.5 | 7.5 | 0 | 0 kNm |
| | | | $\frac{3}{7}$ | $\frac{4}{7}$ | | $\frac{8}{17}$ $\frac{9}{17}$ |
| Balance | | | 3.21 | 4.28 | 3.53 | 4.5 |
| CO | 1.6 | | | -1.765 | 2.14 | 0 |
| Balance | | | 0.756 | 1.01 | -1 | -1.133 |
| CO | 0.378 | | | -0.5 | 0.505 | 0 |
| Balance | | | 0.24 | 0.285 | -0.237 | -0.267 |
| CO | 0.107 | | | -0.118 | 0.142 | |
| Balance | | | 0.051 | 0.067 | -0.067 | -0.075 |
| Total | 2.08 | 4.23 | -4.24 | 5.45 | -5.44 | 0 |

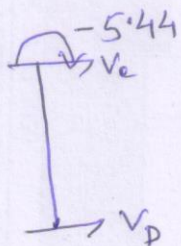

Let us find the shear forces at the supports

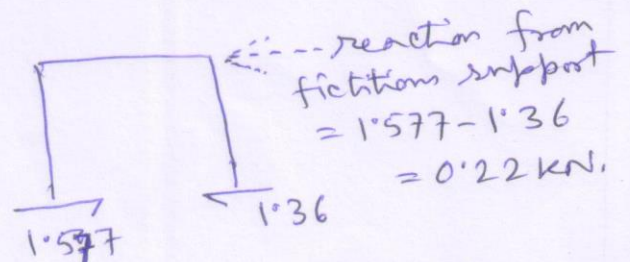

$$\sum M_B = 0 \Rightarrow 4.23 + 2.08 - V_A \times 4 = 0$$

$$V_A = 1.577 \text{ kN}$$

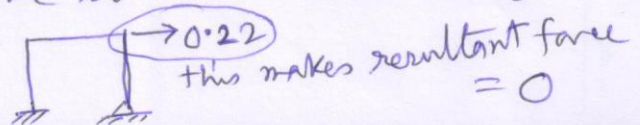

$$\therefore V_D = -\frac{5.44}{4} = -1.36 \text{ kN}$$

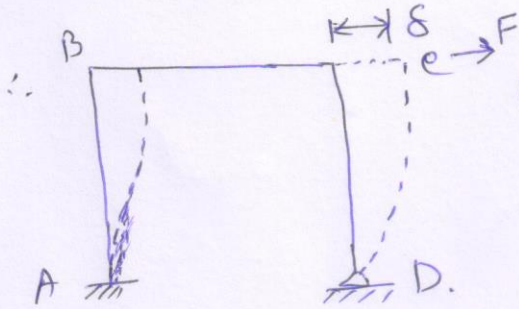

For equilibrium of the frame,
 $\sum \text{horiz. forces} = 0$,

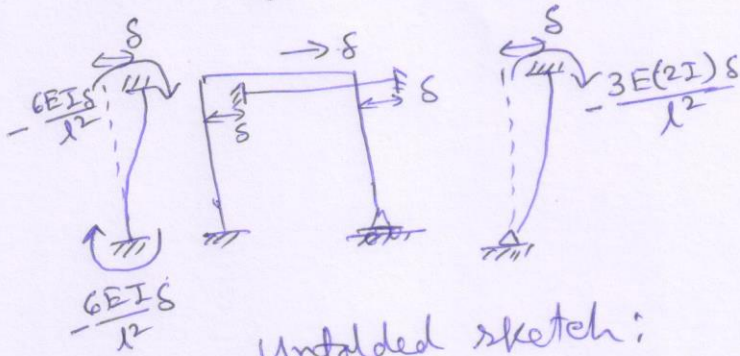

Since there is no real support at "C", the force given by fictitious support must be = 0, i.e., -0.22 kN force to be applied in the current system. In reality the structure will sway to some extent towards right. \therefore

Let us assume that the frame undergoes sway of "S."

Note that S will cause bending in AB and DC. We consider that BC is moving like a rigid beam. In fact if we consider fixed ended beam, we shall get similar results.

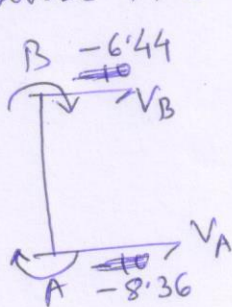

We see that BM developed is having ratio 1:1:1 or 10:10:10 (just multiplied by 10)

Unfolded sketch:

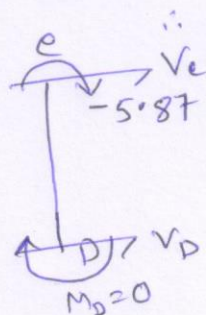

| | | 3/4 | 4/4 | 8/17 | 9/17 | |
|---------|--|--------|-------|-------|-------|-------|
| FEM | | -10 | -10 | 0 | 0 | -10 |
| Balance | | | 4.285 | 5.71 | 4.706 | 5.29 |
| CO | | 2.142 | | 2.85 | 2.85 | |
| Balance | | | -1.01 | -1.34 | -1.34 | -1.51 |
| CO | | -0.505 | | -0.67 | -0.67 | |
| Balance | | | 0.287 | 0.383 | 0.315 | 0.355 |
| Total | | -8.36 | -6.44 | 6.43 | 5.86 | -5.87 |

units (this is not kNm, just a number)

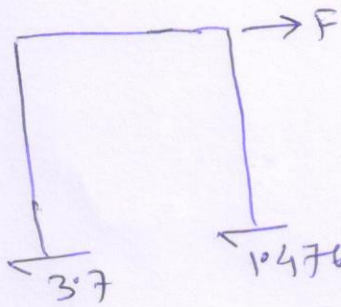

Now, we need to find out the unknown force F required to cause the deflection "S".

$$\sum M_B = 0 \Rightarrow -10 - 10 - V_A \times 4 = 0 \therefore V_A = -3.7 \text{ units}$$

$$\sum M_C = 0 \Rightarrow -5.87 - 4V_D = 0 \therefore V_D = -1.467 \text{ units}$$

$\therefore F = 5.176 \text{ units}$

Now, given that sway force = 0.22 kN

| | | | | | | | |
|--|---|--------|-------|------|-------|---|----------------|
| For $F = 5.176 \text{ units}$ | -8.36 | -6.44 | 6.43 | 5.86 | -5.87 | 0 | units (moment) |
| For $F = 0.22 \text{ kN}$, the BMs are (Sway moments) | $\frac{-8.36}{5.176} \times 0.22$ = -0.355 | -0.273 | 0.273 | 0.25 | -0.25 | 0 | kNm |
| No sway moments | 2.08 | 4.23 | -4.24 | 5.45 | -5.44 | 0 | kNm |
| Final value of moments | 1.725 | 3.96 | -3.96 | 5.7 | -5.7 | | kNm |
