metasls for solution of wished value problems) Can be classified wainly in two types.

(1) Single Step methods (ii) Multistep methods

(1) Single step mathols: The Arbelson at any stop point is obtained by using the solution at previous point. Thus a general single step method can be written as

Jinti = Jn + h & (Henri, Hen, yn, yntigh)

where of, defrendents on f also, is called (2) increment function.

Explicit meteral If & in independent of Unity, tean the method is called explicit and (2) may be written as

Jm= Jn+ hop (An, un, h)

Implicit method: If of depends on und then the mothod is called impolicit.

Local tourcation error or Discretization error: The exact solution u(2en) solishes the schrapen

U(Xn+1) = U(Xn) + h of (Xn+1, Xn, U(2n+1), 4(Xn), h) + Tn+1

where The is called the local truncation error @ or discretization error of the method. Therefore the truncation error is given by

The = u(xnn) - u(xn) - h of (xnn, xn, ul know),

Order of the wothod! The order of a wothod in the largest integer p for which

It That | = O(h)

Taylor series wethod: consider: the IVP

u'=f(t,u), ulto)=n, t[[a,b]

 $t_j = t_0 + jh$, $h = \frac{b-a}{N}$ to $t_1 t_2$

 $u(t_{j+1}) = u(t_j + h)$ = $u(t_j) + hu'(t_j) + \frac{1}{h}u''(t_j) + \frac{1}{31}u''(t_j)$

1 pt (b+1) + + + 1 et clift;) + 7+1

Ti+1 = (p+1) (tj+0h) where 0 < 0 < 1

Now denote lij = u(t;)

 $u_{j+1} = u_j + h u'_j + \frac{h^2}{2!} u''_j + - + \frac{h^4}{4!} u'_j + \frac{h^{4+1}}{(p+1)!} u'_j + \frac{$

Mond define

h \(\text{\$\psi(t_j, \text{\$\frac{t_j}{t_j}, h}} \) = \(h \(u_j' + \frac{h^2}{2!} \(u_j'' + \frac{h^2}{6!} \(u_j'' \) \)

then(1) can be written as

aj+1 = uj + h q (tj, uj, h) + Tj+1 -2

Tj+1 = (p+1)! (b+1) (tj+0h) for some 0x0x1

Thus the method (2) is called Taylor serins method of order p.

Eulszinethod for b=1

Uj+1= Uj+h Uj = Uj+hf(*tj, Uj)

Mote! To use Taylor series method we require u', u", u", u" and soon.

u' = f(t, u)u'' = f(t, u) = f(t, u) = f(t, u) + f(t, u)

 $u''' = \frac{d}{dt}u'' = \frac{d}{dt}\left[f_t(t,u) + f_u(t,u), f(t,u)\right]$

= ft+ ftu u' + (fut + fun u') f + fu (ft + fu u')

= ftt + ftuf + fuf + fuf

1

the error in (2) is given by Tit = LPH (bt)(titoh), for someococ)

the number of twems to be included in 2 is fixed by permissible error. If the error is & and for (tj+0h) is bounded them

= |Tj+1 = [p+1) | (+j+0h) | < E

Cr htt [f(b) (+;+oh)] < E

Cr pH | fp)(+j+04) | LE. (pH)!

Inequality (4) will deturmine & as E, h are known.

Example: solve the aliferential equation y'= t+y y(0)=1, t ∈ [0,1]

by Taylor's series wethal. Determine the number of terms to be included in Taylor's series to dotain an accuracy of 10-10.

 $\sum_{i=1}^{2} u_{i+1} = u_{i+1} + ku_{i}' + \frac{k^{2}}{2!} u_{i}'' + \frac{k^{3}}{2!} u_{i}'' + \frac{k^{2}}{4!} u_{i}'' + \frac$

+ (b+1) 1 (+) (+) (+) (+)

$$y' = t + y'$$

$$y' = y''$$

$$y'' = y'' = y''$$

= 2 et
